# Chapter 1

## Main Page

### 1.1 About

primesieve is a C/C++ library for quickly generating prime numbers. It generates the primes below  $10^9$  in just 0.2 seconds on a single core of an Intel Core i7-6700 3.4GHz CPU from 2015. primesieve can generate primes and prime k-tuplets up to  $2^{64}$ . primesieve's memory requirement is about  $\pi(\sqrt{n}) * 8$  bytes per thread, its run-time complexity is  $O(n \log \log n)$  operations. The recommended way to get started is to first have a look at a few C or C++ example programs. The most common use cases are iterating over primes using `next_prime()` or `prev_prime()` and storing primes in a vector or an array.

For more information please visit <https://github.com/kimwalisch/primesieve>.

### 1.2 Installation

- **Install libprimesieve using package manager.**
- **Build libprimesieve from source.**

### 1.3 C API

- `primesieve.h` - primesieve C header.
- `primesieve_iterator` - Provides the `primesieve_next_prime()` and `primesieve_prev_prime()` functions.
- **C examples** - Example programs that show how to use libprimesieve.
- **C error handling** - How to detect and handle errors.
- **Link against libprimesieve.**

### 1.4 C++ API

- `primesieve.hpp` - primesieve C++ header.
- `primesieve::iterator` - Provides the `next_prime()` and `prev_prime()` methods.
- **C++ examples** - Example programs that show how to use libprimesieve.
- **C++ error handling** - How to detect and handle errors.
- **Link against libprimesieve.**

# Class Documentation

### 5.1 primesieve::iterator Struct Reference

`primesieve::iterator` allows to easily iterate over primes both forwards and backwards.

```
#include <iterator.hpp>
```

#### Public Member Functions

- `iterator ()` noexcept  
*Create a new iterator object.*
- `iterator (uint64_t start, uint64_t stop_hint=std::numeric_limits< uint64_t >::max())` noexcept  
*Create a new iterator object.*
- `void jump_to (uint64_t start, uint64_t stop_hint=std::numeric_limits< uint64_t >::max())` noexcept  
*Reset the primesieve iterator to start.*
- `iterator (const iterator &)=delete`  
*primesieve::iterator objects cannot be copied.*
- `iterator & operator= (const iterator &)=delete`
- `iterator (iterator &&) noexcept`  
*primesieve::iterator objects support move semantics.*
- `iterator & operator= (iterator &&) noexcept`
- `~iterator ()`  
*Frees all memory.*
- `void clear ()` noexcept  
*Reset the start number to 0 and free most memory.*
- `void generate_next_primes ()`
- `void generate_prev_primes ()`
- `uint64_t next_prime ()`  
*Get the next prime.*
- `uint64_t prev_prime ()`  
*Get the previous prime.*

## Public Attributes

- `std::size_t i_`
- `std::size_t size_`
- `uint64_t start_`
- `uint64_t stop_hint_`
- `uint64_t * primes_`
- `void * memory_`

### 5.1.1 Detailed Description

`primesieve::iterator` allows to easily iterate over primes both forwards and backwards.

Generating the first prime has a complexity of  $O(r \log \log r)$  operations with  $r = n^{0.5}$ , after that any additional prime is generated in amortized  $O(\log n \log \log n)$  operations. The memory usage is  $\text{PrimePi}(n^{0.5}) * 8$  bytes.

#### Examples

`prev_prime.cpp`, and `primesieve_iterator.cpp`.

### 5.1.2 Constructor & Destructor Documentation

#### 5.1.2.1 `iterator()` [1/2]

```
primesieve::iterator::iterator ( ) [noexcept]
```

Create a new iterator object.

Generate primes  $\geq 0$ . The start number is default initialized to 0 and the stop\_hint is default initialized `UINT64_MAX`.

#### 5.1.2.2 `iterator()` [2/2]

```
primesieve::iterator::iterator (
    uint64_t start,
    uint64_t stop_hint = std::numeric_limits< uint64_t >::max() ) [noexcept]
```

Create a new iterator object.

#### Parameters

<i>start</i>	Generate primes $\geq$ start (or $\leq$ start).
<i>stop_hint</i>	Stop number optimization hint, gives significant speed up if few primes are generated. E.g. if you want to generate the primes $\leq 1000$ use <code>stop_hint = 1000</code> .

### 5.1.3 Member Function Documentation

#### 5.1.3.1 clear()

```
void primesieve::iterator::clear ( ) [noexcept]
```

Reset the start number to 0 and free most memory.

Keeps some smaller data structures in memory (e.g. the PreSieve object) that are useful if the [primesieve::iterator](#) is reused. The remaining memory uses at most 200 kilobytes.

#### 5.1.3.2 jump\_to()

```
void primesieve::iterator::jump_to (
    uint64_t start,
    uint64_t stop_hint = std::numeric_limits< uint64_t >::max() ) [noexcept]
```

Reset the primesieve iterator to start.

##### Parameters

<i>start</i>	Generate primes $\geq$ start (or $\leq$ start).
<i>stop_hint</i>	Stop number optimization hint, gives significant speed up if few primes are generated. E.g. if you want to generate the primes $\leq$ 1000 use stop_hint = 1000.

##### Examples

[prev\\_prime.cpp](#).

#### 5.1.3.3 next\_prime()

```
uint64_t primesieve::iterator::next_prime ( ) [inline]
```

Get the next prime.

Throws a [primesieve::primesieve\\_error](#) exception (derived from `std::runtime_error`) if any error occurs.

##### Examples

[primesieve\\_iterator.cpp](#).

#### 5.1.3.4 prev\_prime()

```
uint64_t primesieve::iterator::prev_prime ( ) [inline]
```

Get the previous prime.

prev\_prime(n) returns 0 for  $n \leq 2$ . Note that [next\\_prime\(\)](#) runs up to 2x faster than [prev\\_prime\(\)](#). Hence if the same algorithm can be written using either [prev\\_prime\(\)](#) or [next\\_prime\(\)](#) it is preferable to use [next\\_prime\(\)](#).

#### Examples

[prev\\_prime.cpp](#).

The documentation for this struct was generated from the following file:

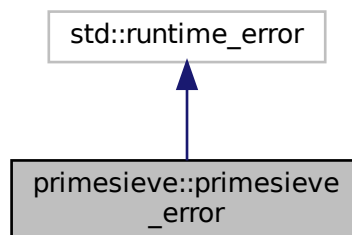

- [iterator.hpp](#)

## 5.2 primesieve::primesieve\_error Class Reference

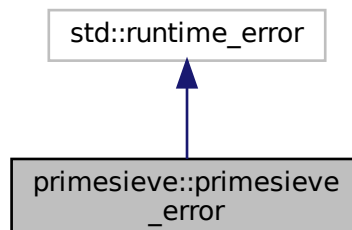

primesieve throws a [primesieve\\_error](#) exception if an error occurs e.g.

- void [primesieve\\_jump\\_to](#) ([primesieve\\_iterator](#) \*it, uint64\_t start, uint64\_t stop\_hint)  
*Reset the primesieve iterator to start.*
- void [primesieve\\_skipto](#) ([primesieve\\_iterator](#) \*it, uint64\_t start, uint64\_t stop\_hint)  
*Reset the primesieve iterator to start.*
- static uint64\_t [primesieve\\_next\\_prime](#) ([primesieve\\_iterator](#) \*it)  
*Get the next prime.*
- static uint64\_t [primesieve\\_prev\\_prime](#) ([primesieve\\_iterator](#) \*it)  
*Get the previous prime.*

### 6.1.1 Detailed Description

[primesieve\\_iterator](#) allows to easily iterate over primes both forwards and backwards.

Generating the first prime has a complexity of  $O(r \log \log r)$  operations with  $r = n^{0.5}$ , after that any additional prime is generated in amortized  $O(\log n \log \log n)$  operations. The memory usage is about  $\text{PrimePi}(n^{0.5}) * 8$  bytes.

The [primesieve\\_iterator.c](#) example shows how to use [primesieve\\_iterator](#). If any error occurs [primesieve\\_next\\_prime\(\)](#) and [primesieve\\_prev\\_prime\(\)](#) return `PRIMESIEVE_ERROR`. Furthermore `primesieve_iterator.is_error` is initialized to 0 and set to 1 if any error occurs.

This file is distributed under the BSD License. See the COPYING file in the top level directory.

### 6.1.2 Function Documentation

### 6.1.2.1 primesieve\_clear()

```
void primesieve_clear (
    primesieve_iterator * it )
```

Reset the start number to 0 and free most memory.

Keeps some smaller data structures in memory (e.g. the PreSieve object) that are useful if the [primesieve\\_iterator](#) is reused. The remaining memory uses at most 200 kilobytes.

### 6.1.2.2 primesieve\_jump\_to()

```
void primesieve_jump_to (
    primesieve_iterator * it,
    uint64_t start,
    uint64_t stop_hint )
```

Reset the primesieve iterator to start.

#### Parameters

<i>start</i>	Generate primes $\geq$ start (or $\leq$ start).
<i>stop_hint</i>	Stop number optimization hint. E.g. if you want to generate the primes $\leq$ 1000 use <code>stop_hint = 1000</code> , if you don't know use <code>UINT64_MAX</code> .

#### Examples

[prev\\_prime.c](#), and [primesieve\\_iterator.c](#).

### 6.1.2.3 primesieve\_next\_prime()

```
static uint64_t primesieve_next_prime (
    primesieve_iterator * it ) [inline], [static]
```

Get the next prime.

Returns `PRIMESIEVE_ERROR (UINT64_MAX)` if any error occurs.

#### Examples

[primesieve\\_iterator.c](#).

#### 6.1.2.4 `primesieve_prev_prime()`

```
static uint64_t primesieve_prev_prime (
    primesieve_iterator * it ) [inline], [static]
```

Get the previous prime.

`primesieve_prev_prime(n)` returns 0 for  $n \leq 2$ . Note that `primesieve_next_prime()` runs up to 2x faster than `primesieve_prev_prime()`. Hence if the same algorithm can be written using either `primesieve_prev_prime()` or `primesieve_next_prime()` it is preferable to use `primesieve_next_prime()`.

##### Examples

[prev\\_prime.c](#).

#### 6.1.2.5 `primesieve_skipto()`

```
void primesieve_skipto (
    primesieve_iterator * it,
    uint64_t start,
    uint64_t stop_hint )
```

Reset the primesieve iterator to start.

##### Parameters

<i>start</i>	Generate primes $>$ start (or $<$ start).
<i>stop_hint</i>	Stop number optimization hint. E.g. if you want to generate the primes $\leq 1000$ use <code>stop_hint = 1000</code> , if you don't know use <code>UINT64_MAX</code> .

## 6.2 `iterator.hpp` File Reference

`primesieve::iterator` allows to easily iterate (forwards and backwards) over prime numbers.

```
#include <stdint.h>
#include <cstdint>
#include <limits>
```

Include dependency graph for iterator.hpp:

This graph shows which files directly or indirectly include this file:

### 6.3.1 Detailed Description

primesieve C API.

primesieve is a library for quickly generating prime numbers. If an error occurs, primesieve functions with a uint64\_t return type return PRIMESIEVE\_ERROR and the corresponding error message is printed to the standard error stream. libprimesieve also sets the C errno variable to EDOM if an error occurs.

## 6.3.2 Enumeration Type Documentation

### 6.3.2.1 anonymous enum

anonymous enum

Enumerator

SHORT_PRIMES	Generate primes of short type.
USHORT_PRIMES	Generate primes of unsigned short type.
INT_PRIMES	Generate primes of int type.
UINT_PRIMES	Generate primes of unsigned int type.
LONG_PRIMES	Generate primes of long type.
ULONG_PRIMES	Generate primes of unsigned long type.
LONGLONG_PRIMES	Generate primes of long long type.
ULONGLONG_PRIMES	Generate primes of unsigned long long type.
INT16_PRIMES	Generate primes of int16_t type.
UINT16_PRIMES	Generate primes of uint16_t type.
INT32_PRIMES	Generate primes of int32_t type.
UINT32_PRIMES	Generate primes of uint32_t type.
INT64_PRIMES	Generate primes of int64_t type.
UINT64_PRIMES	Generate primes of uint64_t type.

## 6.3.3 Function Documentation

### 6.3.3.1 primesieve\_count\_primes()

```
uint64_t primesieve_count_primes (
    uint64_t start,
    uint64_t stop )
```

Count the primes within the interval [start, stop].

By default all CPU cores are used, use [primesieve\\_set\\_num\\_threads\(int threads\)](#) to change the number of threads.

Note that each call to [primesieve\\_count\\_primes\(\)](#) incurs an initialization overhead of  $O(\sqrt{\text{stop}})$  even if the interval [start, stop] is tiny. Hence if you have written an algorithm that makes many calls to [primesieve\\_count\\_primes\(\)](#) it may be preferable to use a [primesieve::iterator](#) which needs to be initialized only once.

Examples

[count\\_primes.c](#).

### 6.3.3.2 primesieve\_count\_quadruplets()

```
uint64_t primesieve_count_quadruplets (
    uint64_t start,
    uint64_t stop )
```

Count the prime quadruplets within the interval [start, stop].

By default all CPU cores are used, use [primesieve\\_set\\_num\\_threads\(int threads\)](#) to change the number of threads.

### 6.3.3.3 primesieve\_count\_quintuplets()

```
uint64_t primesieve_count_quintuplets (
    uint64_t start,
    uint64_t stop )
```

Count the prime quintuplets within the interval [start, stop].

By default all CPU cores are used, use [primesieve\\_set\\_num\\_threads\(int threads\)](#) to change the number of threads.

### 6.3.3.4 primesieve\_count\_sextuplets()

```
uint64_t primesieve_count_sextuplets (
    uint64_t start,
    uint64_t stop )
```

Count the prime sextuplets within the interval [start, stop].

By default all CPU cores are used, use [primesieve\\_set\\_num\\_threads\(int threads\)](#) to change the number of threads.

### 6.3.3.5 primesieve\_count\_triplets()

```
uint64_t primesieve_count_triplets (
    uint64_t start,
    uint64_t stop )
```

Count the prime triplets within the interval [start, stop].

By default all CPU cores are used, use [primesieve\\_set\\_num\\_threads\(int threads\)](#) to change the number of threads.

### 6.3.3.6 primesieve\_count\_twins()

```
uint64_t primesieve_count_twins (
    uint64_t start,
    uint64_t stop )
```

Count the twin primes within the interval [start, stop].

By default all CPU cores are used, use [primesieve\\_set\\_num\\_threads\(int threads\)](#) to change the number of threads.

#### 6.3.3.7 primesieve\_generate\_n\_primes()

```
void* primesieve_generate_n_primes (
    uint64_t n,
    uint64_t start,
    int type )
```

Get an array with the first n primes  $\geq$  start.

## Parameters

<i>type</i>	The type of the primes to generate, e.g. INT_PRIMES.
-------------	--

In case an error occurs the error message is printed to the standard error stream and a NULL pointer is returned. libprimesieve also sets the C errno variable (from <errno.h>) to EDOM if any error occurs. The only advantage which checking errno (after [primesieve\\_generate\\_n\\_primes\(\)](#)) has over checking if a NULL pointer has been returned, is that errno is not set when calling primesieve\_generate\_n\_primes(0, start, type) which is valid (but useless) and which returns a NULL pointer.

## Examples

[primes\\_array.c](#).

## 6.3.3.8 primesieve\_generate\_primes()

```
void* primesieve_generate_primes (
    uint64_t start,
    uint64_t stop,
    size_t * size,
    int type )
```

Get an array with the primes inside the interval [start, stop].

## Parameters

<i>size</i>	The size of the returned primes array.
<i>type</i>	The type of the primes to generate, e.g. INT_PRIMES.

In case an error occurs the error message is printed to the standard error stream, the size is set to 0 and a NULL pointer is returned. In order to distinguish an "error" from "no primes found within [start, stop]" libprimesieve also sets the C errno variable (from <errno.h>) to EDOM if any error occurs. By checking errno after calling [primesieve\\_generate\\_primes\(\)](#) users can reliably detect errors.

## Examples

[primes\\_array.c](#).

## 6.3.3.9 primesieve\_get\_max\_stop()

```
uint64_t primesieve_get_max_stop ( )
```

Returns the largest valid stop number for primesieve.

## Returns

2<sup>64</sup>-1 (UINT64\_MAX).

### 6.3.3.10 `primesieve_nth_prime()`

```
uint64_t primesieve_nth_prime (
    int64_t n,
    uint64_t start )
```

Find the *n*th prime.

By default all CPU cores are used, use [primesieve\\_set\\_num\\_threads\(int threads\)](#) to change the number of threads.

Note that each call to `primesieve_nth_prime(n, start)` incurs an initialization overhead of  $O(\sqrt{\text{start}})$  even if *n* is tiny. Hence it is not a good idea to use [primesieve\\_nth\\_prime\(\)](#) repeatedly in a loop to get the next (or previous) prime. For this use case it is better to use a [primesieve::iterator](#) which needs to be initialized only once.

#### Parameters

<i>n</i>	if <i>n</i> = 0 finds the 1st prime $\geq$ start, if <i>n</i> > 0 finds the <i>n</i> th prime > start, if <i>n</i> < 0 finds the <i>n</i> th prime < start (backwards).
----------	---

#### Examples

[nth\\_prime.c](#).

### 6.3.3.11 `primesieve_set_num_threads()`

```
void primesieve_set_num_threads (
    int num_threads )
```

Set the number of threads for use in `primesieve_count_*`() and [primesieve\\_nth\\_prime\(\)](#).

By default all CPU cores are used.

### 6.3.3.12 `primesieve_set_sieve_size()`

```
void primesieve_set_sieve_size (
    int sieve_size )
```

Set the sieve size in KiB (kibibyte).

The best sieving performance is achieved with a sieve size of your CPU's L1 or L2 cache size (per core).

#### Precondition

`sieve_size`  $\geq 16$  &&  $\leq 8192$ .

## 6.4 primesieve.hpp File Reference

primesieve C++ API.

- Print the prime sextuplets within the interval *[start, stop]* to the standard output.
  - `uint64_t primesieve::get_max_stop ()`
- Returns the largest valid stop number for primesieve.
  - `int primesieve::get_sieve_size ()`
- Get the current set sieve size in KiB.
  - `int primesieve::get_num_threads ()`
- Get the current set number of threads.
  - `void primesieve::set_sieve_size (int sieve_size)`
- Set the sieve size in KiB (kibibyte).
  - `void primesieve::set_num_threads (int num_threads)`
- Set the number of threads for use in `primesieve::count_*`() and `primesieve::nth_prime()`.
  - `std::string primesieve::primesieve_version ()`
- Get the primesieve version number, in the form "i.j".

## 6.4.1 Detailed Description

primesieve C++ API.

primesieve is a library for fast prime number generation, in case an error occurs a `primesieve::primesieve_error` exception (derived from `std::runtime_error`) is thrown.

Copyright (C) 2022 Kim Walisch, [kim.walisch@gmail.com](mailto:kim.walisch@gmail.com)

## 6.4.2 Function Documentation

#### 6.4.2.1 count\_primes()

```
uint64_t primesieve::count_primes (
    uint64_t start,
    uint64_t stop )
```

Count the primes within the interval [start, stop].

By default all CPU cores are used, use `primesieve::set_num_threads(int threads)` to change the number of threads.

Note that each call to `count_primes()` incurs an initialization overhead of  $O(\sqrt{\text{stop}})$  even if the interval [start, stop] is tiny. Hence if you have written an algorithm that makes many calls to `count_primes()` it may be preferable to use a `primesieve::iterator` which needs to be initialized only once.

#### Examples

[count\\_primes.cpp](#).

#### 6.4.2.2 count\_quadruplets()

```
uint64_t primesieve::count_quadruplets (
    uint64_t start,
    uint64_t stop )
```

Count the prime quadruplets within the interval [start, stop].

By default all CPU cores are used, use `primesieve::set_num_threads(int threads)` to change the number of threads.

#### 6.4.2.3 count\_quintuplets()

```
uint64_t primesieve::count_quintuplets (
    uint64_t start,
    uint64_t stop )
```

Count the prime quintuplets within the interval [start, stop].

By default all CPU cores are used, use `primesieve::set_num_threads(int threads)` to change the number of threads.

#### 6.4.2.4 count\_sextuplets()

```
uint64_t primesieve::count_sextuplets (
    uint64_t start,
    uint64_t stop )
```

Count the prime sextuplets within the interval [start, stop].

By default all CPU cores are used, use `primesieve::set_num_threads(int threads)` to change the number of threads.

#### 6.4.2.5 count\_triplets()

```
uint64_t primesieve::count_triplets (
    uint64_t start,
    uint64_t stop )
```

Count the prime triplets within the interval [start, stop].

By default all CPU cores are used, use `primesieve::set_num_threads(int threads)` to change the number of threads.

#### 6.4.2.6 count\_twins()

```
uint64_t primesieve::count_twins (
    uint64_t start,
    uint64_t stop )
```

Count the twin primes within the interval [start, stop].

By default all CPU cores are used, use `primesieve::set_num_threads(int threads)` to change the number of threads.

#### 6.4.2.7 generate\_n\_primes() [1/2]

```
template<typename vect >
void primesieve::generate_n_primes (
    uint64_t n,
    uint64_t start,
    vect * primes ) [inline]
```

Appends the first  $n$  primes  $\geq$  start to the end of the primes vector.

@vect: `std::vector` or other vector type that is API compatible with `std::vector`.

#### 6.4.2.8 generate\_n\_primes() [2/2]

```
template<typename vect >
void primesieve::generate_n_primes (
    uint64_t n,
    vect * primes ) [inline]
```

Appends the first  $n$  primes to the end of the primes vector.

@vect: `std::vector` or other vector type that is API compatible with `std::vector`.

#### Examples

[primes\\_vector.cpp](#).

#### 6.4.2.9 generate\_primes() [1/2]

```
template<typename vect >
void primesieve::generate_primes (
    uint64_t start,
    uint64_t stop,
    vect * primes ) [inline]
```

Appends the primes inside [start, stop] to the end of the primes vector.

@vect: std::vector or other vector type that is API compatible with std::vector.

#### 6.4.2.10 generate\_primes() [2/2]

```
template<typename vect >
void primesieve::generate_primes (
    uint64_t stop,
    vect * primes ) [inline]
```

Appends the primes  $\leq$  stop to the end of the primes vector.

@vect: std::vector or other vector type that is API compatible with std::vector.

#### Examples

[primes\\_vector.cpp](#).

#### 6.4.2.11 get\_max\_stop()

```
uint64_t primesieve::get_max_stop ( )
```

Returns the largest valid stop number for primesieve.

#### Returns

$2^{64}-1$  (UINT64\_MAX).

#### 6.4.2.12 nth\_prime()

```
uint64_t primesieve::nth_prime (
    int64_t n,
    uint64_t start = 0 )
```

Find the nth prime.

By default all CPU cores are used, use `primesieve::set_num_threads(int threads)` to change the number of threads.

Note that each call to `nth_prime(n, start)` incurs an initialization overhead of  $O(\sqrt{\text{start}})$  even if  $n$  is tiny. Hence it is not a good idea to use `nth_prime()` repeatedly in a loop to get the next (or previous) prime. For this use case it is better to use a `primesieve::iterator` which needs to be initialized only once.

**Parameters**

<i>n</i>	if $n = 0$ finds the 1st prime $\geq$ start, if $n > 0$ finds the $n$ th prime $>$ start, if $n < 0$ finds the $n$ th prime $<$ start (backwards).
----------	--

**Examples**

[nth\\_prime.cpp](#).

**6.4.2.13 set\_num\_threads()**

```
void primesieve::set_num_threads (
    int num_threads )
```

Set the number of threads for use in `primesieve::count_*`() and [primesieve::nth\\_prime\(\)](#).

By default all CPU cores are used.

**6.4.2.14 set\_sieve\_size()**

```
void primesieve::set_sieve_size (
    int sieve_size )
```

Set the sieve size in KiB (kibibyte).

The best sieving performance is achieved with a sieve size of your CPU's L1 or L2 cache size (per core).

**Precondition**

`sieve_size  $\geq$  16 &&  $\leq$  8192.`

**6.5 primesieve\_error.hpp File Reference**

The `primesieve_error` class is used for all exceptions within `primesieve`.

```
#include <stdexcept>
```

```
#include <string>
```

Include dependency graph for `primesieve_error.hpp`:

This graph shows which files directly or indirectly include this file:

## Classes

- class `primesieve::primesieve_error`  
*primesieve* throws a `primesieve_error` exception if an error occurs e.g.

### 6.5.1 Detailed Description

The `primesieve_error` class is used for all exceptions within `primesieve`.

This file is distributed under the BSD License. See the COPYING file in the top level directory.

## Chapter 7

# Example Documentation

### 7.1 count\_primes.cpp

This example shows how to count primes.

```
#include <primesieve.hpp>
#include <stdint.h>
#include <iostream>
int main()
{
    uint64_t count = primesieve::count_primes(0, 1000);
    std::cout << "Primes <= 1000: " << count << std::endl;
    return 0;
}
```

### 7.2 primesieve\_iterator.cpp

Iterate over primes using [primesieve::iterator](#).

```
#include <primesieve.hpp>
#include <cstdlib>
#include <iostream>
int main(int argc, char** argv)
{
    uint64_t limit = 10000000000ull;
    if (argc > 1)
        limit = std::atol(argv[1]);
    primesieve::iterator it(0, limit);
    uint64_t prime = it.next_prime();
    uint64_t sum = 0;
    // Iterate over the primes <= 10^9
    for (; prime <= limit; prime = it.next_prime())
        sum += prime;
    std::cout << "Sum of primes <= " << limit << ": " << sum << std::endl;
    // Note that since sum is a 64-bit variable the result
    // will be incorrect (due to integer overflow) if
    // limit > 10^10. However we do allow limits > 10^10
    // since this is useful for benchmarking.
    if (limit > 10000000000ull)
        std::cerr << "Warning: sum is likely incorrect due to 64-bit integer overflow!" << std::endl;
    return 0;
}
```

### 7.3 nth\_prime.cpp

Find the nth prime.

```
#include <primesieve.hpp>
#include <stdint.h>
#include <iostream>
```

```
#include <cstdlib>
int main(int, char** argv)
{
    uint64_t n = 1000;
    if (argv[1])
        n = std::atol(argv[1]);
    uint64_t nth_prime = primesieve::nth_prime(n);
    std::cout << n << "th prime = " << nth_prime << std::endl;
    return 0;
}
```

## 7.4 prev\_prime.cpp

Iterate backwards over primes using `primesieve::iterator`.

```
#include <primesieve.hpp>
#include <cstdlib>
#include <iostream>
int main(int argc, char** argv)
{
    uint64_t limit = 10000000000ull;
    if (argc > 1)
        limit = std::atol(argv[1]);
    primesieve::iterator it;
    it.jump_to(limit);
    uint64_t prime = it.prev_prime();
    uint64_t sum = 0;
    // Backwards iterate over the primes <= 10^9
    for (; prime > 0; prime = it.prev_prime())
        sum += prime;
    std::cout << "Sum of primes <= " << limit << ": " << sum << std::endl;
    // Note that since sum is a 64-bit variable the result
    // will be incorrect (due to integer overflow) if
    // limit > 10^10. However we do allow limits > 10^10
    // since this is useful for benchmarking.
    if (limit > 10000000000ull)
        std::cerr << "Warning: sum is likely incorrect due to 64-bit integer overflow!" << std::endl;
    return 0;
}
```

## 7.5 primes\_vector.cpp

Fill a `std::vector` with primes.

```
#include <primesieve.hpp>
#include <vector>
int main()
{
    std::vector<int> primes;
    // Fill the primes vector with the primes <= 1000
    primesieve::generate_primes(1000, &primes);
    primes.clear();
    // Fill the primes vector with the primes inside [1000, 2000]
    primesieve::generate_primes(1000, 2000, &primes);
    primes.clear();
    // Fill the primes vector with the first 1000 primes
    primesieve::generate_n_primes(1000, &primes);
    primes.clear();
    // Fill the primes vector with the first 10 primes >= 1000
    primesieve::generate_n_primes(10, 1000, &primes);
    return 0;
}
```

## 7.6 count\_primes.c

C program that shows how to count primes.

```
#include <primesieve.h>
#include <inttypes.h>
#include <stdio.h>
int main()
{
    uint64_t count = primesieve_count_primes(0, 1000);
    printf("Primes <= 1000: %u PRIu64\n", count);
    return 0;
}
```

## 7.7 prev\_prime.c

Iterate backwards over primes using `primesieve_iterator`. Note that `primesieve_next_prime()` runs up to 2x faster and uses only half as much memory as `primesieve_prev_prime()`. Hence if it is possible to write the same algorithm using either `primesieve_prev_prime()` or `primesieve_next_prime()` then it is preferable to use `primesieve_next_prime()`.

```
#include <primesieve.h>
#include <inttypes.h>
#include <stdlib.h>
#include <stdio.h>
int main(int argc, char** argv)
{
    uint64_t limit = 10000000000ull;
    if (argc > 1)
        limit = atol(argv[1]);
    primesieve_iterator it;
    primesieve_init(&it);
    /* primesieve_jump_to(&it, start_number, stop_hint) */
    primesieve_jump_to(&it, limit, 0);
    uint64_t prime;
    uint64_t sum = 0;
    /* Backwards iterate over the primes <= limit */
    while ((prime = primesieve_prev_prime(&it)) > 0)
        sum += prime;
    primesieve_free_iterator(&it);
    printf("Sum of the primes: %" PRIu64 "\n", sum);
    /* Note that since sum is a 64-bit variable the result
    * will be incorrect (due to integer overflow) if
    * limit > 10^10. However we do allow limits > 10^10
    * since this is useful for benchmarking. */
    if (limit > 10000000000ull)
        printf("Warning: sum is likely incorrect due to 64-bit integer overflow!");
    return 0;
}
```

## 7.8 primesieve\_iterator.c

Iterate over primes using C `primesieve_iterator`.

```
#include <primesieve.h>
#include <inttypes.h>
#include <stdio.h>
#include <stdlib.h>
int main(int argc, char** argv)
{
    uint64_t limit = 10000000000ull;
    if (argc > 1)
        limit = atol(argv[1]);
    primesieve_iterator it;
    primesieve_init(&it);
    /* Indicate exact bounds to improve performance */
    primesieve_jump_to(&it, 0, limit);
    uint64_t sum = 0;
    uint64_t prime = 0;
    /* Iterate over the primes <= 10^9 */
    while ((prime = primesieve_next_prime(&it)) <= limit)
        sum += prime;
    printf("Sum of the primes <= %" PRIu64 ": %" PRIu64 "\n", limit, sum);
    primesieve_free_iterator(&it);
    return 0;
}
```

## 7.9 nth\_prime.c

C program that finds the nth prime.

```
#include <primesieve.h>
#include <stdlib.h>
#include <inttypes.h>
#include <stdio.h>
int main(int argc, char** argv)
{
    uint64_t n = 1000;
    if (argc > 1 && argv[1])
        n = atol(argv[1]);
    uint64_t prime = primesieve_nth_prime(n, 0);
    printf("%" PRIu64 "th prime = %" PRIu64 "\n", n, prime);
    return 0;
}
```

## 7.10 primes\_array.c

Generate an array of primes.

```
#include <primesieve.h>
#include <stdio.h>
int main()
{
    uint64_t start = 0;
    uint64_t stop = 1000;
    size_t i;
    size_t size;
    /* Get an array with the primes <= 1000 */
    int* primes = (int*) primesieve_generate_primes(start, stop, &size, INT_PRIMES);
    for (i = 0; i < size; i++)
        printf("%i\n", primes[i]);
    primesieve_free(primes);
    uint64_t n = 1000;
    /* Get an array with the first 1000 primes */
    primes = (int*) primesieve_generate_n_primes(n, start, INT_PRIMES);
    for (i = 0; i < n; i++)
        printf("%i\n", primes[i]);
    primesieve_free(primes);
    return 0;
}
```
